Control Modes
- Indexer, Point-to-Point, PVT
- Camming, Gearing, Position, Velocity, Torque

Command Interface
- CANopen
- ASCII and discrete I/O
- Stepper commands
- ±10V position/velocity/torque command
- PWM velocity/torque command
- Master encoder (Gearing/Camming)

Communications
- CANopen
- RS232

Feedback
- Digital Quad A/B encoder
- Secondary encoder / emulated encoder out
- Analog sin/cos encoder
- Resolver
- Digital Halls

I/O - Digital
- 12 inputs, 4 outputs

Accessories
- External regen resistors
- External edge filter

Dimensions: mm [in]
- 7.5 x 5.5 x 2.5 [191 x 140 x 64]

**DESCRIPTION**

Xenus combines CANopen networking with 100% digital control of brushless or brush motors in an off-line powered package that can operate from single or three-phase mains with continuous power output to 4 kW. Xenus is offered in two versions based on the type of feedback. Standard models supports digital quadrature or analog sin/cos encoders. Resolver feedback is available in “-R” models which convert the resolver angle into quadrature encoder signals for using Xenus with external controllers.

Xenus operates as a Motion Control Device under the DSP-402 protocol of the CANopen DS-301 V4.01 (EN 50325-4) application layer. DSP-402 modes supported include: Profile Position, Profile Velocity, Profile Torque, Interpolated Position (PVT), and Homing. Drive commissioning is fast and simple using CME 2 software operating under Windows® communicating with Xenus via CAN or an RS-232 link. CAN address selection is by a 16-position rotary switch on the front panel. If there are more than fifteen devices on a CAN bus, the additional address bits needed can come from programmable inputs, or can be set in flash memory. Profile Position Mode does a complete motion index on command with S-curve acceleration & deceleration, top speed, and distance programmable. In PVT mode, the controller sends out a sequence of points each of which is an increment of a larger, more complex move than a single index or profile. The drive then uses cubic polynomial interpolation to “connect the dots” such that the motor reaches each point (Position) at the specified velocity (Velocity) at the prescribed time (Time).

Homing mode is configurable to work with a variety of limit, index, and home switches such that the drive moves the motor into a position that has an absolute reference to some part of the machine. Eleven logic inputs are programmable as limit or home switches, stepper/encoder pulse inputs, reset, digital torque or velocity reference, or motor-temperature. A twelfth input is dedicated to the drive Enable function. Three programmable logic outputs are for reporting a drive fault or other status indications. A fourth optically-isolated output can drive a motor brake from the external +24 Vdc power supply or can be programmed as a logic output.

In addition to CANopen motion commands, Xenus can operate as a stand-alone drive. Current and velocity modes accept ±10 Vdc analog, digital 50% PWM or PWM/polarity inputs. In position mode inputs can be incremental position commands from step-motor controllers in Pulse/Direction or CW/CCW format, ±10 Vdc analog, or A/B quadrature commands from a master-encoder. Pulse to position ratio is programmable for electronic gearing.

Power output of the drive varies with the input power which can range from 100 to 240 Vac, and from 47 to 63 Hz. Either single or three phase mains can be used giving Xenus the ability to work in the widest possible range of industrial settings. Signal and control circuits are isolated from the high-voltage power supply and inverter stage that connect to the mains. A +24 Vdc input powers control circuits for keep-alive operation permitting the drive power stage to be completely powered down without losing position information or communications with the control system.
GENERAL SPECIFICATIONS (ALL VERSIONS)

Test conditions: Wye connected load: 2 mH line-line. Ambient temperature = 25 °C. Power input = 230 Vac, 60 Hz, 1 Ø

INPUT POWER

| Mains voltage, phase, frequency | 100–240 Vac, ±10%, 1 Ø or 3 Ø, 47–63 Hz |
| Mains current | 20 Arms |
| +24 Vdc Control power | +20 to +32 Vdc, 500 mA max |

DIGITAL CONTROL

| Digital Control Loops | Current, velocity, position. 100% digital loop control |
| Sampling rate (time) | Current loop: 15 kHz (67 µs), Velocity & position loops: 3 kHz (333 µs) |
| Bus voltage compensation | Changes in bus or mains voltage do not affect bandwidth |
| Minimum load inductance | 200 µH line-line |

COMMAND INPUTS (NOTE: DIGITAL INPUT FUNCTIONS ARE PROGRAMMABLE)

As CAN node
| CANopen bus | Position & Velocity Mode commands, Homing, Profile, and Interpolated profile modes |
| Stand-alone mode | Analog torque, velocity, position reference, ±10 Vdc, 12 bit resolution, Dedicated differential analog input |
| Digital position reference | Pulse/Direction, CW/CCW, Stepper commands (2 MHz maximum rate) |
| Digital torque & velocity reference | PWM, Polarity, PWM = 0% - 100%, Polarity = 1/0 |

DIGITAL INPUTS

| Number | 12 |
| Logic levels | Vin-LO < 1.35 Vdc, Vin-HI >3.65 Vdc |
| Pull-up, pull-down control | Inputs are divided into four groups with selectable connection of input pull-up/down resistor to 5 Vdc or ground for each group: [IN1,2,3], [IN4,5], [IN6,7,8], [IN9,10,11,12] |
| Enable [IN1] | 1 dedicated input with 330 µs RC filter for drive enable, Active level programmable, +24 Vdc max |
| GP [IN2,3,4,5,11,12] | 6 General Purpose inputs with 330 µs RC filter, programmable functions, and active level select, +24 Vdc max |
| HS [IN7,8,9,10] | 5 High-Speed Inputs inputs with 100 ns RC filter, programmable functions, and active level select, +12 Vdc max |

DIGITAL OUTPUTS (NOTE 2)

| Number | 4 |
| Current rating | 1 Adc max, +40 Vdc max. Functions programmable |
| Brake [OUT4] | Opto-isolated, current-sinking with flyback diode to +24 Vdc, 1 Adc |

QUADRATURE ENCODER OUTPUTS

Maximum frequency | 18 M-counts, post-quadrature (4.5 M-lines/sec) |
Encoder feedback models
| Operation | Motor encoder signals are buffered and appear on J7 |
| Signals | A, /A, B, /B, X, /X |
| Driver | 26LS31 differential line driver |

Resolver feedback models
| Operation | Quadrature encoder emulation with programmable resolution to 4096 lines (65,536 count/rev) |
| Signals | A, /A, B, /B |
| Driver | 26LS31 differential line driver |

RS-232 PORT
| Signals | RxD, TxD, Gnd in 6-position, 4-contact RJ-11 style modular connector |
| Mode | Full-duplex, serial communication port for drive setup and control, 9,600 to 115,200 baud |
| Protocol | Binary and ASCII formats |

CAN PORTS
| Signals | CANH, CANL, Gnd in 8-position RJ-45 style modular connector, wired as per CAN Cia DR-303-1, V1.1 |
| Format | CAN V2.0b physical layer for high-speed connections compliant |
| Data | CANopen Device Profile DSP-402 |
| Address selection | 16 position rotary switch on front panel with 3 additional address bits available as digital inputs or programmable to flash memory (7-bit addressing, 127 nodes per CAN network) |

STATUS INDICATORS
| Drive Status | Bicolor LED, drive status indicated by color, and blinking or non-blinking condition |
| CAN Status | Bicolor LED, status of CAN bus indicated by color and blink codes to CAN Indicator Specification 303-3 |

REGENERATION
| Operation | Internal solid-state switch drives external regen resistor (see Ordering Guide for types) |
| Cut-In Voltage | +HV > 390 Vdc |
| Drop-Out Voltage | +HV < 380 Vdc |
| Tolerance | ±2 Vdc |
| Hysteresis | 10 ±0.5 Vdc |

NOTES:
1. Heatsinking and/or forced-air cooling is required for continuous output power rating
2. Brake[OUT4] is programmable as motor brake, or as general purpose digital output

AGENCY STANDARDS CONFORMANCE
Limits and Methods of Measurement of Radio Disturbance Characteristics of Industrial, Scientific, and
Medical (ISM) Radio Frequency Equipment
EN 61000-6-1 : 2001 Electromagnetic Compatibility Generic Immunity Requirements
Following the provisions of EC Directive 89/336/EEC.
EN 60204-1 : 1997 Safety of Machinery - Electrical Equipment of Machines
Following the provisions of EC Directive 2006/42/EC.

DIMENSIONS

Weights:
- Drive 3.0 lb (1.36 kg)
- XSL-HS 1.9 lb (0.86 kg)
- XSL-HL 1.26 lb (0.57 kg)

For CE compliance and machine safety use external tooth lockwashers between mounting screw head and drive heatplate. Recommended screws are #6-32 (M3.5) torqued to 8–10 lb·in (0.79–1.02 N·m).
COMMUNICATIONS

CME 2 SOFTWARE
Drive setup is fast and easy using CME 2 software. All of the operations needed to configure the drive are accessible through this powerful and intuitive program. Auto-phasing of brushless motor Hall sensors and phase wires eliminates “wire and try”. Connections are made once and CME 2 does the rest thereafter. Encoder wire swapping to establish the direction of positive motion is eliminated. Motor data can be saved as .ccm files. Drive data is saved as .ccx files that contain all drive settings plus motor data. This eases system management as files can be cross-referenced to drives. Once a drive configuration has been completed systems can be replicated easily with the same setup and performance.

RS-232 COMMUNICATION
Xenus is configured via a three-wire, full-duplex RS-232 port that operates from 9,600 to 115,200 Baud. CME 2 software communicates with the drive over this link for commissioning and adjustments. When operating as a stand-alone drive that takes command inputs from an external controller, CME 2 is used for configuration. When operated as a CAN node, CME 2 can be used for programming before and after installation in a CAN network. Xenus can also be controlled via CME 2 while it is in place as a CAN node. During this process, drive operation as a CAN node is suspended. When adjustments are complete, CME 2 relinquishes control of the drive and returns it to the CAN node state.

CANOPEN COMMUNICATION
Xenus uses the CAN physical layer signals CANH, CANL, and GND for connection, and CANopen protocol for communication. Before installing the drive in a CAN system, it must be assigned a CAN address. A maximum of 127 CAN nodes are allowed on a single CAN bus. The rotary switch on the front panel controls the four lower bits of the seven-bit CAN address. When the number of nodes on a bus is less than sixteen, the CAN address can be set using only the switch. For installations with sixteen or more CAN nodes on a network CME 2 can be used to configure Xenus to use the rotary switch, or combinations of digital inputs and programmed offset in flash memory to configure the drive with a higher CAN node address.

CANOPEN NETWORKING
Based on the CAN V2.0b physical layer, a robust, two-wire communication bus originally designed for automotive use where low-cost and noise-immunity are essential, CANopen adds support for motion-control devices and command synchronization. The result is a highly effective combination of data-rate and low cost for multi-axis motion control systems. Device synchronization enables multiple axes to coordinate moves as if they were driven from a single control card.

CAN Status LED
Drive Fault conditions:
• Over or under-voltage
• Motor over-temperature
• Encoder +5 Vdc fault
• Short-circuits from output to output
• Short-circuits from output to ground
• Internal short circuits
• Drive over-temperature
Faults are programmable to be either transient or latching

DRIVE STATUS LED
A single bi-color LED gives the state of the drive by changing color, and either blinking or remaining solid. The possible color and blink combinations are:
• Green/Solid: Drive OK and enabled. Will run in response to reference inputs or CANopen commands.
• Green/Slow-Blinking: Drive OK but NOT-enabled. Will run when enabled.
• Green/Fast-Blinking: Positive or Negative limit switch active. Drive will only move in direction not inhibited by limit switch.
• Red/Solid: Transient fault condition. Drive will resume operation when fault is removed.
• Red/Flash: Latching fault. Operation will not resume until drive is Reset

Note: Red & green led on-times do not overlap.
LED color may be red, green, off, or flashing of either color.
DIGITAL SERVO DRIVE
for BRUSHLESS/BRUSH MOTORS

COMMAND INPUTS

CANOPEN
As an intelligent node on a distributed-control network the drive can operate in current, velocity, or position mode with all control loops closed in the drive. Using Copley’s CMO (Copley Motion Objects) or CML (Copley Motion Libraries) software, multiple drives can be controlled from high-level languages such as Visual Basic or C++. CANopen operation supports Profile Position, Profile Velocity, Profile Torque and Homing modes. In addition to these operating modes, all of the drive configuration parameters are available in CAN mode offering great flexibility of operation and control.

ASCII
RS-232 communications provides a simple hardware control capability for Xenus in applications that don’t require the power or flexibility provided by CANopen operation. And, while RS-232 does not support multi-drop connections like RS-485, multiple Xenus (or other Copley CANopen drives) can be controlled from a single COM port. This is done by setting the CAN address of the drive that connects to the COM port to “0”, and then using CAN cables to connect other Copley drives in daisy-chain fashion. The “0” drive now acts as a CAN bus master communicating with the other drives over the CAN. The effect is to have the ability to communicate with multiple drives from a single RS-232 port.

INDEXING
As an indexing drive, Xenus can be controlled from digital I/O lines or via CANopen or ASCII, communications. Up to 32 sequences can be addressed with an additional priority for BRUSHLESS/BRUSH MOTORS

DIGITAL REFERENCE INPUTS
In stand-alone mode, digital reference inputs control drive current or velocity in the same fashion as the analog reference input, but do it using digital signals. Digital inputs [IN9] and [IN10] have high-speed input filters and can be programmed for signals in several formats. Current (torque, force) or velocity commands can be in one or two-wire format. In the one-wire format (50% PWM), a single input takes a square waveform that has a 50% duty cycle when the drive output should be zero. Thereafter, increasing the duty cycle toward 100% will command a maximum positive output, and decreasing the duty cycle toward 0% will produce a maximum negative output.

In two-wire format (PWM/Direction), one input takes a PWM waveform of fixed frequency and variable duty cycle, and the other input takes a DC level that controls the polarity of the output current. A 0% duty cycle will command zero current, and a 100% will produce a maximum. The direction of the force or torque produced will depend on the polarity of the DC signal on the direction input. In either mode, inputs are programmable to treat 0% or 100% inputs as faults as a safety measure should a cable break.

PWM U-V REFERENCE INPUTS
In most applications Xenus uses encoder and/or Hall feedback from the motor for commutation. This is the process by which motor currents are constantly adjusted so that they produce a magnetic field in the windings that is at ±90 degrees electrical with the magnetic field of the permanent-magnets so that torque or force is produced in proportion to the magnitude of the currents. For controllers that perform this function externally to the drive, the PWM U-V mode is provided. This provides control of the magnitude and polarity of the currents in the U & V phases of the motor, and sets the W phase current equal to the sum of the U-V currents times (-1).

ANALOG REFERENCE INPUT
A single ±10 Vdc differential input takes inputs from controllers that use PID or similar compensators, and outputs a current command to the drive. Drive output current or velocity vs. reference input voltage is programmable.
INPUT / OUTPUT

DIGITAL INPUTS

Xenus has twelve digital inputs, eleven of which have programmable functions. Input [IN1] is dedicated to the drive Enable function. This is done to prevent accidental programming of the input in such a way that the controller could not shut it down.

Two types of RC filters are used: GP (general purpose) and HS (high speed). Input functions such as Pulse/Dir, CW/CCW, Quad A/B are wired to inputs having the HS filters, and inputs with the GP filters are used for general purpose logic functions, limit switches, and the motor temperature sensor. Programmable functions of the digital inputs are:

- Positive Limit switch
- Negative Limit switch
- Home switch
- Drive Reset
- Pulse & Direction, or CW/CCW step motor position commands
- Quad A/B master encoder position commands
- CAN address bits
- Motor over-temperature
- Reference input attenuation select (zero or divide by eight)

In addition to the active level and function for each programmable input, the input resistors are programmable in four groups to either pull up to +5 Vdc, or down to ground. Grounded inputs with HI active levels interface to PLC’s that have PNP outputs that source current from +24 Vdc sources. Inputs pulled up to +5 Vdc work with open-collector, or NPN drivers that sink current to ground.

BRAKE OUTPUT [OUT4]

This output is an open-drain MOSFET with an internal flyback diode connected to the +24 Vdc input. It can sink up to 1A from a motor brake connected to the +24 Vdc supply. The operation of the brake is programmable with CME 2. It can also be programmed as a general-purpose digital output.

DIGITAL OUTPUTS

The digital outputs are open-drain MOSFETs with 1 kΩ pull-up resistors in series with a diode to +5 Vdc. They can sink up to 1 Adc from external loads operating from power supplies to +30 Vdc.

The output functions are programmable. The active state of the outputs is programmable to be on or off.

When driving inductive loads such as a relay, an external fly-back diode is required. The internal diode in the output is for driving PLC inputs that are opto-isolated and connected to +24 Vdc. The diode prevents conduction from +24 Vdc through the 1 kΩ resistor to +5 Vdc in the drive. This could turn the PLC input on, giving a false indication of the drive output state.
FEEDBACK: ENCODER VERSIONS

DIGITAL ENCODERS
The motor encoder interface is a differential line-receiver with R-C filtering on the inputs. The circuit is shown below. Encoders with differential outputs are required because they are less susceptible to noise that can degrade single-ended outputs. Encoder cables should use twisted-pairs for each signal pair: A & /A, B & /B, Index & /Index. An overall shield should be used, and for longer cables, shields for individual pairs may be necessary to guarantee signal integrity. The encoder signals are made available to the controller via the signal connector J7, where they are re-transmitted by differential line-drivers. This eliminates split cables that would have to route the motor encoder signals to both drive and controller, as well as providing a good signal quality termination of the encoder signals at the drive.

ANALOG ENCODERS
Xenus supports analog encoder signals for position feedback. The Sin and Cos inputs are differential with 121 Ohm terminating resistors and accept 1.0 Vp-p signals in the A/B format used by encoders with analog outputs such as Heidenhain, Stegman, and Renishaw.

DIGITAL HALL SIGNALS
Use of these signals is optional. Xenus is capable of auto-phasing using encoder signals and motor movement on power-up. Hall signals are single-ended signals that provide absolute feedback within one electrical cycle of the motor. There are three of them (U, V, & W) and they may be sourced by magnetic sensors in the motor, or by encoders that have Hall tracks as part of the encoder disc. They typically operate at much lower frequencies than the motor encoder signals, and in Xenus they are used for commutation-initialization after startup, and for checking the motor phasing after the drive has switched to sinusoidal commutation.

FEEDBACK: RESOLVER VERSIONS
RESOLVER
Connections to the resolver should be made with shielded cable that uses three twisted-pairs. Once connected, resolver set up, motor phasing, and other commissioning adjustments are made with CME 2 software. There are no hardware adjustments.
MULTI-MODE ENCODER PORT

This port consists of three differential input/output channels that take their functions from the drive Basic Setup. For dual-loop position-mode operation that employs a primary encoder on the motor, and a secondary encoder on the load, the port works as an input receiving the secondary encoder’s quad A/B/X signals.

For stand-alone operation with an external motion controller, the signals from the digital encoder on the motor are buffered and made available at the control signal connector for transmission to the controller. This eliminates split-wired motor cables with dual connectors that take the encoder signals to both drive and controller.

When used with ServoTube motors, or other motors using analog encoders with sin/cos signal format, the drive interpolates the sin/cos signals to a resolution that is programmable. The incremental changes in position are then converted to digital quad A/B/X format for use by the external motion controller.
NOTES:
1. The total output current from the +5 Vdc supply to J7-22 and J8-3 cannot exceed 400 mAdc.
### ACCESSORY CABLE CONNECTIONS

**SIGNAL CABLE (XSL-CC-10)**

Cable assembly: CCC p/n 59-00785-000
Molded connector mates with drive J8 and has flying-lead terminations.

Cable shields connect to connector shells and not to conductors. The shells of drive J7 & J8 are connected to the earth ground terminal on power connector J1 and to the drive chassis. When the cables above are connected to the drive a continuous path from cable shield to earth is established for shielding and CE compliance.

### J7 Cable Connector:
- **Solder Cup, 26 position male, 1.27 mm pitch**
- **Cable:** 26 conductor, shielded
- **Standard with Snap locks**
  - 3M: 10126-3000 VE connector
  - 3M: 10326-52F0-008 backshell
- **Rugged with Screw-locks**
  - Molex: 54306-2619 connector
  - Molex: 54331-0261 backshell

### J8 Cable Connector:
- **Solder Cup, 20 position male, 1.27 mm pitch**
- **Cable:** 20 conductor, shielded
- **Standard with Snap locks**
  - 3M: 10120-3000VE connector
  - 3M: 10320-52F0-008 backshell
- **Rugged with Screw-locks**
  - Molex: 54306-2019 connector
  - Molex: 54331-0201 backshell

**Note:** Molded cable assemblies are available for J7 & J8.
See Accessories p. 18
 DRIVE POWER SOURCES
An external +24 Vdc power supply is required, and powers an internal DC/DC converter that supplies all the control voltages for drive operation. Use of an external supply enables CAN communication with the drive when the mains power has been removed. Power distribution in Xenus is divided into four sections: +24 Vdc, CAN, signal, and high-voltage. Each is isolated from the other and all are isolated from the chassis.

EXTERNAL +24 VDC
The primary side of the DC/DC converter operates directly from the external +24 Vdc supply and is isolated from other drive power sections. The Brake output (OUT4) operates directly from the external +24 Vdc supply and is isolated from all drive power sections. The Brake output (OUT4) operates directly from the external +24 Vdc supply and is isolated from all drive power sections. The Brake output (OUT4) operates directly from the external +24 Vdc supply and is isolated from all drive power sections.

INTERNAL SIGNAL POWER
The signal power section supplies power for the DSP controller as well as logic inputs and outputs. Motor feedback signals such as Halls, encoder, and temperature sensor operate from this power source. All signal circuits are referenced to signal ground. This ground should connect to the control system circuit ground or common so that drive and controller inputs and output voltage levels work properly with each other.

MAINS POWER
Mains power drives the high-voltage section. It is rectified and capacitor-filtered to produce +HV which the PWM stage converts into voltages that drive either three phase brushless or DC brush motors. An internal solid-state switch together with an external power resistor provides dissipation during regeneration when the mechanical energy of the motor is converted back into electrical energy that must be dissipated before it charges the internal capacitors to an overvoltage condition. All the circuits in this section are "hot", that is, they connect directly to the mains and must be considered high-voltages and a shock hazard requiring proper insulation techniques during installation.

GROUNDING
A grounding system has three primary functions: safety, voltage-reference, and shielding. As a safety measure, the primary ground at J1-3 will carry fault-currents from the mains in the case of an internal failure or short-circuit of electronic components. Wiring to this is typically done with the green conductor with yellow stripe using the same gauge wire as that used for the mains. The pin on the drive at J1-3 is longer than the other pins on J1 giving it a first-make, last-break action so that the drive chassis is never ungrounded when the mains power is connected. This wire is a ‘bonding’ conductor that should connect to an earthed ground point and must not pass through any circuit interrupting devices. All of the circuits on J1, J2, and J3 are mains-connected and must never be grounded. The ground terminals at J1-3, J2-1, and J3-1 all connect to the drive chassis and are isolated from all drive internal circuits.

Signal grounding references the drive control circuits to those of the control system. These controls circuits typically have their own earth connection at some point. To eliminate ground-loops it is recommended that the drive signal ground be connected to the control system circuit ground. When this is done the drive signal voltages will be referenced to the same 0 V level as the circuits in the control system. Small currents flow between controller and drive when inputs and outputs interact. The signal ground is the path for these currents to return to their power sources in both controller and drive.

Shields on cables reduce emissions from the drive for CE compliance and protect internal circuits from interference due to external sources of electrical noise. Because of their smaller wire gauge, these should not be used as part of a safety-ground system. Motor controls can be safety-grounded either at the motor, by earthing the frame, or by a grounding conductor in the motor cable that connects to J2-1. This cable should be of the same gauge as the other motor phase cables.

For CE compliance and operator safety, the drive should be earthed by using external tooth lockwashers under the mounting screws. These will make contact with the aluminum chassis through the anodized finish to connect the chassis to the equipment frame ground.

REGENERATION
The chart below shows the energy absorption in W-s for a Xenus drive operating at some typical mains voltages. When the load mechanical energy is greater than these values an external regen resistor is available as an accessory.

SINGLE-DRIVE SETUP FOR CANOPEN POSITION CONTROL

**Xenus** operates as a CAN node. All commands are passed on the CAN bus. **CME 2** is used for setup and configuration before installation as CAN node.

---

### Serial Cable Kit SER-CK
Connects a PC serial port to Xenus RX-232 connector J5:
- (1) RS-232 9-pin Sub-D to RJ-11 adapter
- (2) 6 ft (2 m) RJ-11 cable

---

### CANopen Network Kit XSL-NK
Connects a CAN card to Xenus connector J6 and includes terminator for ‘last’ drive on CAN bus:
- (1) CAN card 9-pin Sub-D to RJ-45 adapter
- (2) 6 ft (2 m) RJ-45 cable
- (3) CAN terminator

---

### Connector/Cable Kit XSL-CA
Includes connectors J1–J4, J7 & J8:
- (1) Molded 10 ft (3 m) cables for J7 & J8
- (2) Wago connectors for J1–J4

---

### Connector/Cable Kit XSL-CK
Includes connectors for J1–J4, J7, J8:
- (1) Soldercup connectors for J7 & J8
- (2) Wago connectors for J1–J4

---

See diagram on page 7 for connections to:
- J1 AC mains power
- J2 Motor phases
- J3 Regen resistor
- J4 +24 Vdc Aux Power

---

### ORDERING GUIDE
This table shows parts to order for the configuration on this page. See page 23 for other parts required (motor, +24 Vdc power supply, etc.):

Add -R to Xenus part number for resolver feedback model
STAND-ALONE OPERATION

*Xenus* takes digital position commands in Pulse/Direction, or CW/CCW format from an external controller or quadrature encoder signals from a master-encoder for electronic gearing. Velocity or torque control can be from ±10V, digital PWM signals. *CME 2* used for setup and configuration.

Add -R to *Xenus* part number for resolver feedback model

ORDERING GUIDE

This table shows parts to order for the configuration on this page
See page 23 for other parts required (motor, +24 Vdc power supply, etc.)
Each component is labeled *Required*, *Optional*, or *CE*. 
*Required* components are necessary for operation of Xenus in all cases. 
*Optional* components depend on the particular application. 
*CE* after Required indicates that these parts are necessary for CE compliance.

### PARTS USED IN ALL CONFIGURATIONS

**REQUIRED, CE**
- Fuses
- AC Line Filter

**REQUIRED**
- Brushless Servo Motor with Encoder (digital or analog)  
  Digital Halls (optional) or 
  Resolver 
  Thermal sensor (optional)

**REQUIRED**
- DC Brush Servo Motor with Encoder (digital or analog)  
  or 
  Resolver 
  Thermal sensor

---

**Optional**
- Heat-sink
- One motor is always required. It may be brushless or brush.

---

**Optional**
- Regen 
- Resistor 
- XTL-RA-03 
- XTL-RA-04

---

**REQUIRED**
- +24 Vdc 
  Power Supply
NEW FEATURES

Xenus Encoder models manufactured after March, 2005 have enhanced features and can be identified by the red square on the label. The new features are:

- Indexing
- ASCII communications
- Multi-mode encoder port
  - Emulated encoder outputs from ServoTube motors
  - Buffered digital encoder outputs
  - Secondary encoder input
HEATSINK & FAN CONFIGURATIONS

HEATSINK MOUNTING
A dry-film interface pad is used in place of thermal grease. The pad is die-cut to shape and has holes for the heat sink mounting screws. There are two protective sheets, blue on one side and clear on the other. Both must be removed when the interface pad is installed.

STEPS TO INSTALL
1. Remove the blue protective sheet from one side of the pad and place the pad on the drive. Make sure that the holes in the pad align with the holes on the drive.
2. Remove the clear protective sheet from the pad.
3. Mount the heatsink onto the drive taking care to see that the holes in the heatsink, pad, and drive all line up.
4. Torque the #6-32 mounting screws to 8~10 lb-in (0.9~1.13 N·m).

NOTE: FANS ARE NOT INCLUDED WITH HEATSINKS OR HEATSINK KITS

Copley Controls, 20 Dan Road, Canton, MA 02021, USA

Tech Support: E-mail: sales@copleycontrols.com, Internet: http://www.copleycontrols.com
Page 24 of 26
The charts below show that maximum ambient temperature vs. continuous output current for the Xenus models. The cooling options are no heatsink, standard heatsink, and low-profile heatsink. For each of these the drive can be operated with convection or forced-air cooling.
## ORDERING GUIDE

### Example: Order one Xenus drive, resolver version, 6/18 A with solder-cup connector Kit, CME 2 CD, serial cable kit and small heatsink fitted at the factory:

<table>
<thead>
<tr>
<th>Qty</th>
<th>Item</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>XSL-230-18-R-HS</td>
<td>Xenus servo drive</td>
</tr>
<tr>
<td>1</td>
<td>XSL-CK</td>
<td>Connector Kit</td>
</tr>
<tr>
<td>1</td>
<td>CME 2</td>
<td>CME 2 CD</td>
</tr>
<tr>
<td>1</td>
<td>SER-CK</td>
<td>Serial Cable Kit</td>
</tr>
</tbody>
</table>

Note: The heatsink can be fitted at the factory by adding an "-HS" or "-HL" to the drive part number to specify the standard or low-profile type. For fitting a heatsink to an drive in the field, complete kits are available (XSL-HS and XSL-HL). These kits contain the heatsink, mounting hardware, and dry-film interface.
